

Summary: Finance Transaction

- **Half of All Payments Are Failing (Critical Issue)** Out of 12,000 total transaction attempts, the data shows an exact **49.97% success rate** and a **50.03% failure rate**. This means the business is effectively losing half of its sales at the checkout counter, directly causing massive revenue losses, decreasing customer trust, and creating an influx of support complaints.
- **Suspiciously High Fraud Flags Across All Categories** The system flags **49.24% of all transactions** as fraudulent. This risk is uniformly spread across all major spending categories, led by **Travel (50.35%)**, **Food (50.23%)**, and **Bills (50.00%)**. Because these rates are almost exactly half for every single category, it is highly likely that your security system is using overly broad rules that mistake normal customers for scammers.
- **Preferred Digital Payment Channels Are Underperforming** The two digital methods that modern customers use and prefer most are failing the most frequently. **Cards carry the lowest success rate at 48.25%**, followed by **UPI at 48.75%**. Meanwhile, legacy methods like Cash (51.88%) and Netbanking (50.45%) perform better, proving there is major, avoidable friction in your primary digital channels.
- **HDFC Bank Exhibits the Weakest Performance** When analysing success by specific financial institutions, **HDFC stands out as the weakest performer with a 48.04% success rate**, while ICICI leads at 51.08%. This indicates a need to urgently review your payment gateway routing rules and response patterns for HDFC-issued cards or accounts.
- **Kerala Dominates Regional Transaction Value** Kerala is your clear powerhouse market, generating **₹120.4 million in transaction value** more than double the next highest states (West Bengal at ₹58.5M and Karnataka at ₹58.4M). This heavy concentration makes Kerala your most strategically important region for both revenue expansion and risk management.
- **Top Categories by Volume: Recharge** leads both in transaction count (2061 transactions) and total transaction value (₹79.67M), closely followed by **Shopping (₹79.35M)** and **Travel (₹79.06M)**.
- **Success & Failure Rates:** Payment success fluctuates heavily by category. **Bill payments** enjoy the highest success rate (**52.14%**), whereas **Food orders** see the worst performance with a **47.80%** success rate.

Key Business Decisions

- **Get an Automatic Backup Payment System**
Since NetBanking and Cards fail so often, your website needs an automated backup system. If your primary bank processor is too slow or fails, the platform should instantly and invisibly switch the transaction to a backup payment gateway (like Razorpay or Cashfree) so the customer never sees an error.
- **Add Extra Security Steps for Large Purchases**
To stop the desktop browser fraud waves without slowing down normal shoppers, enforce extra verification (like an SMS OTP or biometric scan) only when an order crosses a high-value threshold (such as ₹50,000) or looks suspicious.
- **Add retry flows for failed digital payment**
